

Relationship attributes

Relationship attributes allow you to connect records and show the bidirectional relationship between them. Updating the value of an entity attribute on one record will also automatically update the value on any connected records.

For example, if we look at the page with the list of attributes for the opportunity entity:

Name	Attribute type	Definition
Customers	Customer relationship (Many-to-one)	Many-to-one relationship. Many opportunities can be attached to one customer. The same opportunity can't be attached to more than one customer.
Partners	Partner relationship (Many-to-many)	Many-to-many relationship. Many opportunities can be attached to many partners. The same opportunity can be attached to more than one partner. The same partner can be attached to more than one opportunity.

Now we will look at the **Customer entity**, to see what the relationship looks like there:

Notice how here it's reversed for the opportunity<>customer relationship.

Name	Attribute type	Definition
Opportunities	Opportunity relationship (One-to-many)	One-to-many relationship. One customer can be attached to many opportunities. One opportunity can't be attached to more than one customer.

We can create the following relationship attributes:

- One-to-many
- Many-to-one
- Many-to-many
-

The Relationship Attribute allows entities to be connected to each other with a structured relationship type. This attribute type is available for all entities, and users can configure its behavior.

When a **relationship attribute** is created in the **attribute settings** for one entity, it is **automatically created** in the attribute list of the linked entity. This means users **do not need to manually create the relationship twice**.

Relationship Attributes Behavior [🔗](#)

- **Predefined by default** → We will automatically create relationships like:
 - **Partners** ↔ **Customers** (Many-to-Many)
 - **Partners** ↔ **Opportunities** (Many-to-Many)
 - **Opportunities** ↔ **Customers** (Many-to-One)
- Automatically created in both attached entities → If a user creates a “Customers” relationship in **Partners**, a “Partners” relationship is automatically added to **Customers**.
- **Configurable in the UI** → Users **can**:
 - **Rename** the relationship label (e.g., rename "Customers" to "Clients").
 - **Change the relationship type** (Many-to-Many, One-to-Many, Many-to-One).
 - **Whether the attribute is mandatory** (if required, an entity cannot be saved without a selection).
 - **Add new custom relationship attributes** connecting different entities.

For now:

- Users can't create relationships between the same entity (Partner ↔ Partner). But later, we will add this.

Relationship Types Available [🔗](#)

Each **relationship** follows one of three structures:

1 Many-to-One → Connect many records of the first entity with one record of the second entity.

- Example:
 - Many opportunities can be attached to one customer.
 - The same opportunity **can't** be attached to more than one customer.
 - The same customer **can** be attached to more than one opportunity.

2 One-to-Many → This allows you to select one record of the first entity and connect it to many records of the second entity.

- Example:
 - Connect Customers with an Opportunity entity to connect one customer with many opportunities.
 - The same customer **can** be attached to many opportunities.
 - The same opportunity **can't** be attached to more than one customer.

3 Many-to-Many → Connect many records of the first entity with many records of the second entity.

- Example: Many opportunities can be attached to many partners.
 - The same opportunity **can** be attached to more than one partner.
 - The same partner **can** be attached to more than one opportunity.
